Team Organization

Our team was organized with an Adhoc Agile development team structure. We were self-organized and self-managed to allow for maximum flexibility in modular development. We distributed tasks in pairs so that we weren't alone when tackling new challenges, and could make progress on modules quickly. This was the best fit for our team because we were managing new technologies and languages. These included Swift, SwiftUI, Firebase, CloudKit, Core Data, and XCode. Over the month we were in development, we prioritized team communication and progress updates, creating working software, assessing expectations and ensuring quality of deliverables to the client, and responding to changes dynamically to stay on track.
